

Consciousness

Consciousness is a force, (another Hindu genetic memory) like the electroweak, strong, and gravitational forces of nature. It is localized in each conscious individual in an implicate order, as a particle. In a multi-dimensional context, it is more generalized in an explicate order, spread out like a wave function. It moves at supraluminal speeds. It also has a quantum-like nature in which as a particle it is a dimension, dimension x ; as a wave function it is dimension fx . Consciousness is a supraluminal force being not only quantified as a particle and/or wave function, but can simultaneously be two or more different dimensions as well.

Gravity is a force so subtle it defies measurement in the subatomic realm, but is obvious in the macrocosmic world. Previously thought of as a quantum property of mass-less gravitons, which have not been seen or have gravity waves been measured. Why? Because gravity does not exist like the virtual particles such as photons and it is not limited by lightspeed. It may very well be a dimension in itself. It could be that the interplay between consciousness and gravity create the interplay of matter and antimatter engendering a continual being and not being of our universe.

Consciousness or tachyons race through all existence at supraluminal speed. Since it originated in real time it can only be in one place at one time, the exclusion principle. It travels from point A through everything back to point A at the apparent time of lightspeed. The effect is a quantum wobble of particle A at the speed of light. This massive amount of acceleration could be responsible for the apparent curvature of our spatial dimensions. The matter-antimatter interactions that take place are so quick as to prevent annihilation but still perturb space engendering the dimension of gravity. The time it takes for consciousness to return to point A is the time taken by the interplay between matter and antimatter. When consciousness leaves point A, there is nothing separating point A from antipoint A creating this subtle perturbation. Lightspeed is only our relativistic observation of a far faster and subtler event. The supraluminal movement of thought or our consciousness gradually evolves us into the next dimensions. These tesarachian dimensions are full of fascinating lifeforms and new spaces, which we will be able to interact with and explore in our future.
